Operation . . . . . . . . . . $-10-+50^{\circ} \mathrm{C}\left(14^{\circ} \mathrm{F}-122^{\circ} \mathrm{F}\right)$
Storage . . . . . . . . . . . $-10-+50^{\circ} \mathrm{C}\left(14^{\circ} \mathrm{F}-122^{\circ} \mathrm{F}\right)$

## Actuator for Valves

M1500 is an electro-mechanical actuator for the control of two-way and three-way plug valves in:

- domestic hot water systems
- heating systems
- air handling systems

M1500 is either controlled by an increase/decrease 3-point floating signal or by a modulating $0-10 \mathrm{~V}$ control signal. Modulating control makes for a faster positioning of the actuator.

The electronic circuitry of the actuator ensures that the running time is the same, regardless of the stroke of the valve in question.

It is easy to mount and connect the actuator. It can be mounted directly onto TAC's control valves, without any mounting kit.

For Satchwell valves use L2SV linkage
(see accessory).
The working range of the actuator is adjusted automatically depending on the stroke of the valve. The electronic circuitry of the actuator then takes care of the adjustment of the valve end positions.

The actuator is supplied by 24 V AC . It can provide a position indicator signal 2-10 V and a 16 V DC voltage supply for older TAC controllers.

## PART NUMBERS

| Designation | Explanation | Part Number |
| :--- | :--- | :--- |
| M1500 | modulating control signal or increase/decrease signal | $880-0450-000$ |
| M1500-S2 | modulating control signal or increase/decrease signal and end point switches | $880-0451-000$ |

DIMENSIONS mm (in)

Fig 1

## FUNCTION

Fig 2

## MOUNTING

The actuator may be mounted horizontally, vertically and in any position in between, but not upside down, see figure 3.
N.B.! Do not use the actuator for the DN15 valves V298, V282, V294, V384, V386 and V394.

To mount the actuator on a valve, slide the actuator onto the valve neck, thus making the square nut on the valve spindle fit into the groove on the cross bar. Then slide the brace into the groove on the valve neck and secure the nuts.

## 4

Hot media hazard. Before removing actuator from valve or opening the valve, ensure that the valve control medium is isolated and relive the pressure. Work should only be carried out by a competent engineer.

## CONNECTIONS

| Block | Function | Description |
| :--- | :--- | :--- |
| G | 24 V AC | Supply voltage |
| G0 | 24 V AC rtm | Supply voltage |
| X1 | Input | Control signals <br> (VH, VC short-Circuited |
| MX | Input, neutral | to G0) |
| VH | Increase | Supply for RC |
| VC | Decrease |  |
| G1 | 16 V DC |  |
| Y | $0-100 \%$ |  |

N.B.! When installed with three conductors, where the control signal reference is connected to GO, the motor current of the actuator will cause varying voltage loss in the cable and thus in the reference level. Forta, which has a highly sensitive control signal input, will detect the varying signal and follow it, which makes it difficult for the actuator to find a stable position.

This variation may be accepted in simplified installations on the following conditions: the cables between the controller and actuator are shorter than 100 m ( 328 ft .), the cross-sectional area is larger than 1.5 mm 2 (AWG 16) and the cables are only connected to one actuator. Please refer to the figures labelled "Simplified installation" for wiring instructions.

## Cable lengths

The cables to G, G0 and G1 should be max. 100 m ( 328 ft .) and have a cross-sectional area of min. $1.5 \mathrm{~mm}^{2}$ (AWG 16).

Other cables should be max. 200 m (656 ft.) and have a cross-sectional area of min. $0.5 \mathrm{~mm}^{2}$ (AWG 20).

## MOUNTING

Fig 3

When $T^{\circ}$ exceeds $120^{\circ}$ we reccomend to mount the actuator between $45^{\circ}$ and in horizontal position (see drawing)

## CONNECTIONS

## WIRING EXAMPLES

Modulating control, 24 V AC supply to the controller
(TAC 239W, TAC 6711,
TAC Xenta, TAC 8000,
TAC 230U, TAC 2000,
TAC 9000, TAC 77xx)

Modulating control 16 V DC supply to the controller
(TAC 218E/RM, TAC 221L, TAC 228R/RL/ RF, TAC 239W, TAC 258R/RL, TAC 268R/ RL/RF)

Normal installation ( 5 wires to the actuator)

Modulating control, galvanically isolated output in the controller (TAC 6501, TAC 6505)

Fig 6

|  | Function in the <br> "OFF" pos. | "ON" position | Description |
| :---: | :--- | :--- | :--- |
| 1 | In | Out | Valve closing screw <br> direction |

| 7 | Normal | Inverted | Direction of movement |
| 8 | Normal | Linear/Logarithmic | Valve characteristic |
| 9 | Operation | End position adjust <br> (mom.) | Operation/End position <br> adjustment |

## SETTINGS

Fig 8

There are nine switches in a row on the circuit board. On delivery ('Factory'), all switches are in the "OFF" position.

1 Valve Closing Screw Direction- IN / OUT IN direction of movement is used when the screw of the actuator moves inwards to close the valve.

OUT direction of movement is used when the screw of the actuator moves outwards to close the valve.

## Note! $\mathrm{Y}=2 \mathrm{~V}$ at close valve.

2 Control signal—MOD / INC
TAC Forta can either be controlled by a variable direct voltage, a so called modulating signal (MOD), or by an increase/decrease signal (INC).

3 Sequence or parallel control- - - / SEQ With sequence (or parallel) control (SEQ), two actuators/valves can be controlled by only one control signal.

For each of these you can choose which part of the voltage range to use, the upper one, $5-10 \mathrm{~V}$ (6-10 V) or the lower one, $0-5 \mathrm{~V}(2-6 \mathrm{~V})$.

If the switch NORM / INV is in the NORM position, the higher voltage corresponds to 100\% flow and the lower one to 0\%.

With NORM / INV in the INV position you will get the opposite function.

Note! If sequence or parallel control is not used, the switch - - - / SEQ must be in the OFF position, as the switch MOD / INC is not valid during sequence or parallel control.

4 Voltage range-0-10 / 2-10
You can choose whether to use the control signal voltage range 0-10 V or 2-10 V.

5 Part of voltage range-0-5, 2-6 / 5-10. 6-10 You can choose which part of a voltage range to use, the lower one 0-5 V (2-6 V) or the upper one $5-10 \mathrm{~V}(6-10 \mathrm{~V})$.

If the switch is in the NORM position, the higher voltage corresponds to $100 \%$ flow and the lower one to $0 \%$. To achieve the opposite function, the switch should be put in its INV position.

6 Running time-60 s / 300 s
With increase/decrease control, you can choose a running time between 60 s or 300 s .

With modulating control, the running time is always $15 \mathrm{~s} / 20 \mathrm{~s} / 30 \mathrm{~s}$ depending of stroke valve.

7 Direction of movement-NORM / INV
When normal direction of movement is used, the screw of the actuator moves inwards when the control voltage decreases or if the actuator gets a decrease signal.

With the switch NORM / INV, the direction of movement can be changed.

## 8 Linearization-NORM / LIN/LG

The motorized valve characteristics can be modified. If you wish for the characteristics to be affected, the setting LIN/LG will make the characteristics of an equally modified percentage (EQM) valve almost linear.

On the other hand, with LIN/LG a motorized valve equipped with a linear valve will operate with "Quick open characteristics". This means that with a small control signal, the valve will be almost completely open.

# © <br> Note! For the actuator to register new settings of the switches, the supply voltage must be cut or the manual operation handle lowered, the settings done, and then the handle raised again. 

Please refer to illustration on page 2.
(This does not apply to the switch OP/ADJ).
9 End position adjustment-OP / ADJ
This switch is only used to adjust the end positions when the actuator is commissioned.

Momentarily put the switch in the ON position. The actuator will automatically find the end positions of the valve.

## ACTUATOR INSTALLATION

Before installing it is necessary to remove the antistatic protection placed under the cover.

The switches on the circuit board should be set before the actuator is installed. There are no other switches or potentiometers that should be set or adjusted.

To make an end position adjustment, you only have to switch the switch »OP/ADJ« into its ADJ position, when the supply voltage has been turned on, and then back to its OP position.

When an end position adjustment is made, Forta closes the valve and opens it fully. The adjustment is finished by the actuator closing the valve again; the electronic circuitry then adjusts the stroke and the running time to the valve. The set values are stored in the EEPROM of the actuator so that they will remain after a loss of voltage.

When the end position adjustment is complete, the actuator starts to control the valve according to the control signal.

## MAINTENANCE

The actuator is maintenance-free.
